

Pistol Grip Cutter

Innovations In Pliers

There is no more perfect match than the two halves that make a pair of Snap-on® pliers.

That's because we make both pieces at the same time on the same machine so the mating surfaces are identical. The joint is smooth, the jaw tips line up exactly and the cutters are perfectly aligned. The jaws are precision-forged and the cutters are differentially heat treated. The teeth are milled like file teeth, sharp and strong, for outstanding grip even at the tips of the jaws. Overlapping cutters are made to shear the work with less effort, and stay sharp longer.

Our Stork® series needle nose and gripping pliers reach farther, grip harder and do more things than ever. And wait until you get your hands on the ergonomic pistol-grip model!

You'll find Snap-on® pliers handle just about everything, from electronic assembly to plumbing, from retaining rings to high voltage, from bending to brake work.

Another perfect match: Your hand and Snap-on® pliers. Nothing even comes close™.
